Chapter 1. Introduction

This document defines the SUBPART C - Structure - Flight Loads of the:DroneVLA.The boundaries of the flight envelope will be defined within this document. All speeds are calibrated airspeeds (CAS) (requirement 4.4 [1])and given in knots if not stated otherwise.All other units used are metric (SI units).The weights are given in mass units (kg) but the formulas require force units as input,therefore these are calculated in place wherever they are used.Note: The speeds defined within this document should be used for the placards,speed markings, aeroplane flight manual (limitations), load calculations and need to be verified by flight test.

HERE BELOW AN EXAMPLE OF REFERENCES TO BE EDITED

Chapter 3. List of Abbreviations

ADD HERE list of abbreviations as a formatted table....to be created

Chapter 4. Aircraft data

Add here all the aircraft geometrical, aero and inertial and masses data useful for following paragraph

4.1. Geometry

The aircraft reference geometry is summarized in table:Ref:wingRef:horiRef:vertRef:fus

Table 4.1. Wing Geometrical Parameters

Wing parameters	Value	Measure unit
b	5.2	meters
S	2.589	square meters
AR	10.446	-
taper	1	Non dimensional
sweep	0	degrees
sweep_location	0	percentage
secondary_sweep_location	0	percentage
croot	0.498	m
ctip	0.498	m
xle	1.638	meters
yle	0	meters
zle	0.165	meters
xtip_le	NaN	% fuselage length
dihedral	0	degrees
mac	0.498	m
xmac	NaN	% fuselage length
ymac	NaN	% semispan
ypos	NaN	% semispan
zpos	NaN	% fuselage diameter
camberloc	0.15	Percentage
thickchord	0.18	Percentage
twist_angle	3	degrees

The aircraft reference geometry is summarized in table:Ref:wingRef:horiRef:vertRef:fus

Table 4.2. horizontal Geometrical Parameters

horizontal parameters	Value	Measure unit
S	0.529	square meters

horizontal parameters	Value	Measure unit
l	1.492	meters
camber	0	percentage
camberloc	NaN	percentage
thickchord	0.12	percentage
twist	0	degrees
twistloc	0.25	percentage
xloc0	1.49	meters
xloc	3.128	meters
yloc	0	meters
zloc	0.15	meters
xrot	0	meters
yrot	0	meters
zrot	0	meters
b	1.496	meters
ctip	0.3136	meters
croot	0.3929	meters
sweep	15	degrees
sweeploc	0	percentage
secsweeploc	1	percentage
dihedral	0	degrees
location_of_camber	0.2	percentage
secondary_sweep_location	1	percentage

The aircraft reference geometry is summarized in table:Ref:wingRef:horiRef:vertRef:fus

Table 4.3. Vertical Geometrical Parameters

vertical parameters	Value	Measure unit
MAC	0.23354	m
l_vt	1.65	m

The aircraft reference geometry is summarized in table:Ref:wingRef:horiRef:vertRef:fus

Table 4.4. Fuselage Geometrical Parameters

Fuselage parameters	Value	Measure unit
length	3.64	meters
diameter	0.42	meters
Non_dim_radius_of_gyration	0.34	Non dimensional
Radius_of_gyration	NaN	meters

4.2. Aerodynamic

The aircraft reference aerodynamic is in figure:polars_wb

Subplot 1: C_L vs α — Subplot 2: C_D vs α

Subplot 2: C_D vs C_L — Subplot 3: C_M vs α

Chapter 5. Design Airspeeds

This chapter defines the operating and design airspeeds as required for certification
REFFFF

5.1. Maximum speed in level flight VH

According to flight tests [5] at maximum weight and maximum continuouspower at sea
level conditions, the maximum speed in level flight has been determined:V_H=130\ kts

5.2. Stall speeds VS, VS0, VS1

These speeds will be verified by flight test according to requirement 4.4.1 [1]In
order to calculate the stall speed, the maximum lift coefficient of the aeroplane as
a whole is determined first.The maximum lift coefficient of the aeroplane has been
calculated starting from the polar curve of the wing profiletaken form ref. [6] (p.
236, Re=2.9E6 flaps retracted c_(L_profile_max)=1.35 and p.237, δ_f=40 deg for the
flapsin landing configurationc_(L_profile_flapped_max)=2.15, and δ_f=10 deg in take-off
configurationc_(L_profile_flapped_to)=1.70).Considering the horizontal tail balancing force
and the lower total wing lift due to wing lift distribution,the total aeroplane lift coefficient
has been lowered by 15% with respect to the one of the profile.

Flaps retracted(cleam configuration):

$$V_S = \sqrt{\frac{2\,W_{MTOM}}{\rho_0 C_{L_{MAX_{Clean}}} S}} = \sqrt{\frac{2*981}{1.225*1.6137*2.589}} = 19.7891 m/s$$

Flaps extended(Landing configuration):

$$V_{S_0} = \sqrt{\frac{2\,W_{MTOM}}{\rho_0 C_{L_{MAX_{Landing}}} S}}$$

Flaps extended(Take-off configuration):

$$V_{S_1} = \sqrt{\frac{2\,W_{MTOM}}{\rho_0 C_{L_{MAX_{Takeoff}}} S}}$$

Therefore aeroplane lift coefficient is estimated toc_(L_clean_max)=0.85*1.35=1.15and
for the landing configuration (since the span extension of the flaps is half of
the span of the wing):c_(L_flaps_max)=(c_(L_profile_flapped_max)+ c_(L_profile_max))/
2*0.85=(2.15+1.35)/2*0.85=1.49

The stall speed in landing configuration (flaps fully extended toxxx degrees degrees)isXXX
kts.Therefore it is In accordance with CS-LSA.5 [4].In Take-Off configuration (flaps
extended to ,xxx degreesdegrees) the stall speed is ,xxxkts.

(Note: These speeds are estimates. The methods for the estimation can be various.It is important that these estimations are as precise as possible. Flight tests will be used to validatethe stall speeds. In case the flight tests show different values, this might have an impact on the speedsused for design and ultimately might impair the compliance to the CS-LSA.5.)
